The DSL Conundrum — You have a problem...

A Conundrum

Design

Case Study 1

Case Study 2

Conclusion

DSL Design

Case Study 1 — TTRPG “dice expressions”

Case Study 2 — OpenD6 spells

Conclusion

# You have a Problem...

DSL Design with  
Python

S.Lott

A Conundrum

Design

Case Study 1

Case Study 2

Conclusion

Descend to find a door with a giant lock and two keys with labels.

Above the door is this quote:

*Some people, when confronted with a problem, think "I know, I'll use regular expressions." Now they have two problems.*

The labels:

1. “RE’s are bad;  $RE \subseteq DSL \therefore \forall DSL's \text{ are bad. } \blacksquare$ ”
2. “They always lie.”

# The "RE is two problems" fallacy

DSL Design with  
Python

S.Lott

RE syntax is an ugly jumble of infix and postfix operators.

Overuse of regular expressions can be bad.

(The famous Jamie Zawinski quote was about PERL.)

You know: "When your only tool is a hammer..."

Benefit: a DSL decomposes a problem.

1. The Domain-Specific Language...
2. Used to solve the problem.

# Are there better RE's?

A digression

DSL Design with  
Python

S.Lott

A Conundrum

Design

Case Study 1

Case Study 2

Conclusion

Consider Al Sweigart's HUMRE.

It has all the regular expression features.

In **Python** syntax.

HUMRE is a DSL for regular expressions in Python syntax.

# Are there better RE's?

A digression

DSL Design with  
Python

S.Lott

A Conundrum

Design

Case Study 1

Case Study 2

Conclusion

Consider Al Sweigart's HUMRE.

It has all the regular expression features.

In **Python** syntax.

HUMRE is a DSL for regular expressions in Python syntax.

*And. Bonus. It supports my thesis.*

## Section 2

### DSL Design

Behind the entrance door is a dark hallway.

DSL Design with  
Python

S.Lott

A Conundrum

Design

Case Study 1

Case Study 2

Conclusion

The hallway leads to another door. A sign on the door says  
**Model**.

On your left, you find a door labeled **Syntax**.

# The **Syntax** workroom

DSL Design with  
Python

S.Lott

## Door 1:

two work tables

- ▶ **Tokenizer**  
tools and  
libraries and  
modules.

- ▶ **Parser**  
more tools and  
libraries.

Books by **DABEAZ**  
everywhere.

A pile of parts  
labeled **Lark**.

## Door 2:

a shelf with labels

- ▶ JSON
- ▶ YAML
- ▶ TOML
- ▶ HUML

## Archway:

flanked by two  
friendly-looking  
snakes.

*[Pythons? Roll an  
Intellect check.]*

You entered turning  
left through the  
**Syntax** door...  
The **Model** door is  
still ahead of you!

A Conundrum

Design

Case Study 1

Case Study 2

Conclusion

# Why the Python door?

DSL Design with  
Python

S.Lott

You don't need yet another parser.

But *whatabout...?*

- ▶ Security? The DSL is Code!

A Conundrum

Design

Case Study 1

Case Study 2

Conclusion

# Why the Python door?

DSL Design with  
Python

S.Lott

You don't need yet another parser.

But *what about...?*

- Security? The DSL is Code!

A chaotic evil 9th level Sorcerer won't waste time  
hacking

`rot13("vzcbeg bf; bf.flfgrz('sbezng p:'))")`  
into DSL-based content.

The **whole app** is visible, hackable Python.  
Consider a side-quest to query the Sphinx.

# Why the Python door?

DSL Design with  
Python

S.Lott

You don't need yet another parser.

But *what about...?*

- Security? The DSL is Code!

A chaotic evil 9th level Sorcerer won't waste time  
hacking

`rot13("vzcbeg bf; bf.flfgrz('sbezng p:'))")`  
into DSL-based content.

The **whole app** is visible, hackable Python.

Consider a side-quest to query the Sphinx.

- The really ugly data model?

# Why the Python door?

DSL Design with  
Python

S.Lott

You don't need yet another parser.

But *what about...?*

- Security? The DSL is Code!

A chaotic evil 9th level Sorcerer won't waste time  
hacking

`rot13("vzcbeg bf; bf.flfgrz('sbezng p:'))")`  
into DSL-based content.

The **whole app** is visible, hackable Python.

Consider a side-quest to query the Sphinx.

- The really ugly data model?

Wait for case study 2.

A Conundrum

Design

Case Study 1

Case Study 2

Conclusion

## Section 3

Case Study 1 — TTRPG “dice expressions”

## Example

3d6+2

“roll 3 six-sided dice, add 2”

## Example

4d8

“roll 4 eight-sided dice”

There's more, but that's for lower levels of the dungeon.

Which path?

- ▶ Turn left and write RE's for the syntax?
- ▶ Define Python classes and objects?

## Example

3d6+2

“roll 3 six-sided dice, add 2”

## Example

4d8

“roll 4 eight-sided dice”

There's more, but that's for lower levels of the dungeon.

Which path?

- ▶ Turn left and write RE's for the syntax?
- ▶ Define Python classes and objects?

The syntax isn't Pythonic.

A Conundrum  
Design

Case Study 1  
Case Study 2  
Conclusion

# How to proceed?

DSL Design with  
Python

S.Lott

A Conundrum

Design

Case Study 1

Case Study 2

Conclusion

Strategy Tip: Adjust the syntax to be Pythonic

From this:  $3d6 + 2$ .

To this: `3 * D6 + 2`

# How to proceed?

DSL Design with  
Python

S.Lott

A Conundrum

Design

Case Study 1

Case Study 2

Conclusion

## Strategy Tip: Adjust the syntax to be Pythonic

From this:  $3d6 + 2$ .

To this: `3 * D6 + 2`

Python syntax lets you teleport straight to the data model.

# How to proceed?

DSL Design with  
Python

S.Lott

A Conundrum

Design

Case Study 1

Case Study 2

Conclusion

Strategy Tip: Adjust the syntax to be Pythonic

From this:  $3d6 + 2$ .

To this: `3 * D6 + 2`

Python syntax lets you teleport straight to the data model.

But *what about* the users?

It's a \*.

Create significant leverage and they'll embrace it.

# The Dice class

DSL Design with  
Python

S.Lott

```
class Die:  
    def __init__(self, faces: int = 6, n: int = 1) -> None:  
        ...  
    def __rmul__(self, other: Any) -> Die:  
        match other:  
            case int():  
                return Die(self.faces, n * other)  
            case _:  
                return NotImplemented  
    def roll(self) -> int:  
        ...  
  
D6 = D(6)
```

This is the data model.

# The Dice class

DSL Design with  
Python

S.Lott

```
class Die:  
    def __init__(self, faces: int = 6, n: int = 1) -> None:  
        ...  
    def __rmul__(self, other: Any) -> Die:  
        match other:  
            case int():  
                return Die(self.faces, n * other)  
            case _:  
                return NotImplemented  
    def roll(self) -> int:  
        ...  
  
D6 = D(6)
```

This is the data model. And,  $3*D6$  is valid DSL.

## Section 4

Case Study 2 — **OpenD6** spells

# Context — legacy data

**OpenD6** rules have an Open Gaming License (OGL), making them open source with attribution.  
Perfect for extensions and customizations.

I wanted **all** the magical spell definitions.

# Context — legacy data

**OpenD6** rules have an Open Gaming License (OGL), making them open source with attribution.  
Perfect for extensions and customizations.

I wanted **all** the magical spell definitions.

Which are in PDF's.

# Context — legacy data

**OpenD6** rules have an Open Gaming License (OGL), making them open source with attribution.  
Perfect for extensions and customizations.

I wanted **all** the magical spell definitions.

Which are in PDF's. Scanned from a printed copy.

Case Study 1  
Case Study 2  
Conclusion

# Example DSL statement

DSL Design with  
Python

S.Lott

```
Spell(  
    name="Push",  
    skill="Apportation",  
    notes="Even the most subtle of things,,,,"  
    effect=TimeEffect("sends a small object into the future", "10 min"),  
    duration=DurationAspect(measure="10 minutes"),  
    range=RangeAspect(measure="touch"),  
    casting_time=CastingTimeAspect(measure="1 round"),  
    speed=SpeedAspect.based_on(("range",), ""),  
    other_aspects={  
        "gestures": GesturesAspect("Wave one hand ...", "simple"),  
        "incantations": IncantationsAspect(  
            "Where did it go?", "sentence"  
        ),  
    },  
)
```

A Conundrum  
Design  
Case Study 1  
Case Study 2  
Conclusion

It has a lot of boilerplate. API design needs work.

# Typical DSL use cases

DSL Design with  
Python

S.Lott

- ▶ Represent legacy content and rules in the DSL.
- ▶ Compute derived values from DSL.  
(Compare with legacy sources as acceptance test case.)
- ▶ Present content in RST format for publication.
- ▶ Identify special cases and possible errors.

## Strategy Tip: Replace tears with tiers

Foundation Your ugly domain model that really captures **everything** the end users are prattling on about.

API A layer on top of the ugly foundation that creates the classes and objects for a pleasant, easier-to-use DSL.

This is Pythonic OO design.

Patterns to use:

- ▶ Façade – Koan 5: flat is better than nested
- ▶ Adapter – Koan 8: make special cases fit the rules

# Appendix

## Malicious Actors

## Are **all** elements present?

- ▶ Untrusted sources of DSL, and
- ▶ Large DSL docs, and
- ▶ Difficulty in doing code validation.

Two strategies:

1. Use JSON or TOML.

Use a `@classmethod` to build DSL model objects from  
`dict[str, Any]` content.

2. Don't allow DSL modules to use `import`.

Use the **Compile-Check-Exec** pattern.

# Avoid import with Compile-Check-Exec

## Compile

```
source = Path(module).with_suffix(".py").read_text()  
spell_book_code = ast.parse(source, module, "exec")
```

## Check

```
visitor = AllImports(source)  
visitor.visit(spell_book_code)  
if visitor.imports:  
    raise ValueError(f"import detected: {visitor.imports}")
```

## Exec

```
global_defs: dict[str, Any] = {}  
local_vars: dict[str, Any] = {}  
exec("from magic2 import *", global_defs, local_vars)  
exec(source, global_defs, local_vars)  
return local_vars["spells"]
```

# The AllImports visitor

```
class AllImports(ast.NodeVisitor):
    def __init__(self, source: str) -> None:
        self.source = source
        self.imports: list[str | None] = []

    def visit_Import(self, node: ast.Import) -> None:
        self.imports.append(ast.get_source_segment(self.source, node))

    def visit_ImportFrom(self, node: ast.ImportFrom) -> None:
        self.imports.append(ast.get_source_segment(self.source, node))
```
